

Camera Option for Message Board

Full-sized message boards can be outfitted with a camera that can extend above the board to monitor traffic. This option is useful in smart work zones. By using real-time traffic information supplied by the camera, transportation officials can customize messages to warn motorists about what is actually happening ahead.

The camera option allows the camera to be raised to nearly **20 feet** above the ground.

These message boards with cameras also include a tilt and rotate solar array for optimal solar power collection.

To customize the messages via Command Center, the Message Boards will require the remote communications option to be enabled.

Camera image transmission will require a separate modem and cell service. Manufacturer's warranty apply.
